

EM2 Features

- Two-channel quadrature with index
- High-resolution version of EM1
- Single 5V supply
- Rotary versions up to 10,000 CPR
- Linear versions up to 2,000 CPI
- Internal decoupling capacitor
- Outputs source/sink 5 mA

EM2 Product Description

The EM2 is a transmissive optical encoder module designed to provide up to 4x higher resolution than the EM1. The module detects rotary or linear movement when paired with an encoder disk or linear strip. The EM2 consists of a lensed LED source and a monolithic detector IC enclosed in a small polymer package identical to the EM1. The EM2 uses phased array detector technology allowing for a wider gap tolerance and excellent tolerance to some disk contamination.

The EM2 provides digital A & B quadrature outputs with a third output index channel. Each EM2 module is resolution-specific and is matched to the resolution of an encoder disk. The EM2 operates with a single 5V supply and provides single-ended outputs capable of sinking and sourcing 5mA. An internal 0.1 μ F decoupling capacitor is designed into the EM2 to provide enhanced noise immunity.

For open collector and higher voltage applications, add the PC3 (<https://www.usdigital.com/products/accessories/interfaces/cable-drivers/pc3/>) cable driver, or for differential cable driver outputs, add the PC4 (<https://www.usdigital.com/products/accessories/interfaces/cable-drivers/pc4/>) cable driver. Encoder disks, quadrature decoder chips, counter chips, computer interface boards, mating connectors, and cables are also available.

TIMING CHARACTERISTICS

ENCODING CHARACTERISTICS:

- Specifications apply over the entire operating temperature/voltage range.
- Values are for the worst error over full rotation.
- Refer to the timing diagram below.

TIMING DIAGRAM:

CPI: The number of Cycles (C) of the A or B output Per Inch of linear strip movement.

CPR: The number of Cycles (C) of the A or B outputs Per Revolution.

Index (I): The index output goes high once per revolution, coincident with the low states of channels A and B, nominally 1/4 of one cycle (90 °e).

One Shaft Rotation: 360 mechanical degrees.

One Electrical Degree (°e): 1/360th of one cycle.

One Cycle: 360 electrical degrees (°e). Each cycle can be decoded into 1 or 4 states, referred to as X1 or X4 resolution multiplication.

PPR: The number of resolvable Positions Per Revolution of the encoder disk with x4 quadrature decoding.

Quadrature (Z): The phase lag or lead between channels A and B in electrical degrees, nominally 90 °e.

Symmetry: A measure of the relationship between (X) and (Y) in electrical degrees, nominally 180 °e.
